

Project Pieces: Data Exploration and Visualization

Samantha Piatt

April 4, 2018

Looking at these plots, the DIS values don't seem to influence whether or not the SITL selected that time point. So we can likely leave it out, or it will get excluded in reduction automatically.

Another note, DES_Temperature para & perp seems to have a little bit of a linear relationship.

It also looks like FGM_Magnetic_Field y & z seem to have a relationship of sorts, but when we look at it more closely, it has some weird complex relationship with two 'hot' spots and a V shape.
